

User Research

(Both qualitative and quantitative)

***Milestone 2: Understanding why users are not using voice input
on the Chat Gpt mobile app in India***

NAME: VAISHNAVI KULKARNI

BATCH: 42

BY: NEXTLEAP

Segments who are likely to use ChatGPT mobile

User Segmentation Overview

User segmentation helps in grouping users based on shared characteristics such as demographics, behaviors, needs, or device attributes, to better understand and address their motivations, pain points, and usage patterns.

Category	Details
Demographics	• Age: 15–40 • Tier 1 & 2 cities • Multiple languages
Device Attributes	• Mobile & Desktop • Android OS • App & Website
User Behaviors	• Frequency patterns • Use cases • Engagement levels

User Segments:

Category	Details
Students	Age: 15–25+ Device: Mobile (Android App) Behavior: Project work, assignments, learning, skill building, exam prep Frequency: Daily or several times a week
Job Seekers	Age: 24–45+ Device: Mobile (Android/iOS), sometimes laptop Behavior: Resume writing, interview prep, learning Frequency: Daily
Regional Language Users	Age: 18–50 Device: Mobile (Android) Behavior: Translation, regional news Frequency: Few times a week
Content Creators	Age: 20–40 Device: Mobile & Laptop (Android/iOS) Behavior: Video ideas, scripting, captions, editing Frequency: Daily

Why Student Segment?

1. Size: India has the largest student population — over 300 million across schools, colleges, and universities.
2. Adoption :Students are early tech adopters, experimental users with high behavioral familiarity with voice assistants.
3. Frequency: High-frequency usage, often daily for homework, exam prep, assignments, and quick knowledge queries.
4. Criticality: Each use has the potential to be highly valuable, creating strong engagement and retention.

Hypotheses on Voice Input Non-Usage with Supporting User Insights

Hypotheses

Hypothesis 1: Low Awareness & Feature Discoverability

Some students may not realize the voice input feature exists or may not see clear benefits over typing.

Hypothesis 2: Habit & Workflow

Students already have established habits (copy-paste, text search, digital notes) and may not be proactively searching for or experimenting with new input methods like voice, unless prompted.

Hypothesis 3: Accuracy Issues (Accent & Language)

Many Indian students speak in mixed languages (English + Hindi/regional), and voice recognition often misinterprets such inputs.

Hypothesis 4: Privacy & Social Discomfort

Speaking aloud can feel socially awkward or intrusive when peers are around or disturbing others.

quantitative analysis

qualitative analysis

Few Pain points and suggestions based on qualitative research

Pain points

- Typing feels faster and more accurate
- Privacy concerns
- Limited use cases(copy/paste or edit text, which is harder via voice)
- Performance and Cognitive Friction
- Low feature visibility

User Suggestions

- Make the mic icon more visible
- Add quick tutorial or prompt to introduce the feature
- Improve accuracy for Indian accents and regional languages
- Reduce delay in transcription
- Stronger noise filtering

Problem Framing Canvas

What is the true problem?

Students are not using the voice input feature on ChatGPT mobile because it feels inconvenient, inaccurate, and socially uncomfortable. They find typing more reliable for academic queries requiring precision.

Who are the customers facing the problem?

Primary: College and university students in India (17–25 years).
Secondary: School students and exam aspirants. They are mobile-first, digitally native users relying on ChatGPT for study and learning.

How do we know it is a real problem?

Low usage data for voice vs. text input, survey findings show students avoid voice due to accent issues, public discomfort, and accuracy concerns.

What is the value generated by solving this problem?

For Students: Faster, hands-free learning, easier access for regional users, improved study efficiency.

For ChatGPT: Higher engagement and retention, stronger foothold in Indian market, differentiation through better multilingual voice UX.

Why should we solve this problem now?

India's student user base is rapidly growing. Voice UX can drive engagement and retention. Competitors are advancing in voice tech, and improving this now positions ChatGPT ahead in multilingual AI interactions.
